

Blushield Tesla Gold Plug-In Models

Instructions for use

The Blushield Tesla plug-in comes ready to be plugged into an existing wall socket in a central part of the area to be covered, whether it is your home, workplace or school.

Use a dedicated plug-in point, trying to avoid plugging into a power board with multiple plug outlets.

The plug-in covers 45 metres in all directions (90 metre diameter).

The large plug-in covers 90 metres in all directions (180 metre diameter), from the point of plug-in.

As long as the Blushield Tesla plug-in is left plugged in (indicated by the blue LED at the bottom hole in the case in the plug-in and at the side in the case of the large plug-in) it will affect all people within the field range.

The Blushield Tesla will penetrate normal floors and walls (gib or wooden). A normal size house should only require one unit. In multi-storied office buildings more than one per floor may be required, depending on the area to be covered. When deciding on a position, remember that it is designed to affect people not equipment, so place closer to people.

Do not plug the Tesla plug-in model in the room where you sleep as the LED, which stays on for three seconds, roughly every thirty seconds, may be distracting. You should experience better quality sleep on installing the Tesla plug-in.

A few people report that within the initial first few days using the Blushield they feel low in energy or tired. This is a transient condition and will pass within a few days. This is the body adjusting to a new environment. Elderly people or persons who have poor health may take longer to adjust, in extreme cases up to 4-6 weeks.

The Blushield Tesla is safe to use with computers and will not erase data as the Blushield is non-magnetic. The Blushield does not emit any electromagnetic fields so does not generate interference which may affect sensitive equipment, including pacemakers.

Blushield complies with EMC emission standards EN 50082-1:1992 and EN 50081-1. The Blushield Tesla series meets electrical safety standard NZ/AS 3100.

The Blushield is not an ionizer. Blushield does not remove EMF nor does it modify EMF. Using an EMF meter will not indicate any change in the environment. An EMF meter will not indicate the actual neutralisation of electrical fields as the Blushield works at a biological level, internal to the cell.

The Blushield Tesla models emit a scalar field, to which the body responds at a cell level. Blood tests were used to determine the effectiveness of Blushield technology.

The Blushield is guaranteed against faulty parts or workmanship for a 1-year period from date of purchase. This does not cover wear and tear, neglect, or misuse of the product. Warranty does not cover lightning strike or power surge.

The Blushield plug-in may need to be repaired after a power surge, in which case the customer pays all costs, relating to repair or replacement of the product.

This is not a therapeutic device and must not be sold as one. Any health benefits derived from the use of this device are purely consequential and no medical claims are stressed or implied.
